

SUMMER EXAMINATION 2026
E-commerce Application Development
BSIT - 3rd Semester Time: 90 Minutes Max Marks: 80

Name: _____ Roll No.: _____ Date: _____

1. E-commerce is the buying and selling of goods or services through
(A) electronic networks (B) only physical stores
(C) radio broadcasts (D) printed catalogs
2. B2C describes transactions between
(A) business and consumer (B) businesses only
(C) consumer and government (D) employees only
3. C2C platforms primarily connect
(A) consumers with consumers (B) banks with regulators
(C) manufacturers with servers (D) governments with firms
4. A marketplace model commonly earns revenue through
(A) commissions or listing fees (B) CPU cycles
(C) file permissions (D) sensor voltage
5. Subscription revenue is based on
(A) recurring payments (B) one-time auctions only
(C) random discounts (D) inventory destruction
6. HTTP is mainly used for
(A) web request and response transfer (B) password hashing
(C) database normalization (D) image compression only
7. HTTPS adds HTTP protection using
(A) TLS encryption (B) FTP tunneling
(C) plain text (D) DNS caching only
8. In a client-server system, the client usually
(A) requests services (B) stores every server record
(C) routes packets physically (D) issues certificates
9. The front end is primarily responsible for
(A) user interface and interaction (B) database backups
(C) tax filing (D) server rack cooling
10. The back end commonly handles
(A) business logic and data access (B) screen pixels only
(C) browser history (D) keyboard firmware
11. A three-tier architecture separates presentation, application logic, and
(A) data (B) marketing
(C) payment cards (D) DNS names
12. MVC separates model, view, and
(A) controller (B) cache
(C) certificate (D) customer
13. In MVC, the model represents
(A) data and domain state (B) page styling only
(C) HTTP transport (D) user passwords only
14. Microservices decompose a system into
(A) independently deployable services (B) one giant database table
(C) static HTML only (D) one shared process only
15. An API is a defined interface for
(A) software interaction (B) image cropping
(C) tax calculation only (D) font selection
16. REST commonly identifies resources with
(A) URIs (B) random passwords
(C) MAC addresses only (D) SQL triggers
17. The SDLC phase that clarifies user needs is
(A) requirements analysis (B) deployment
(C) archiving (D) encryption
18. Unit testing focuses on
(A) small software components (B) the whole market
(C) payment settlement (D) network topology
19. Acceptance testing checks whether the system meets
(A) business requirements (B) CPU temperature
(C) font availability (D) DNS records
20. A product catalog stores product details such as
(A) name, price, and stock (B) only customer passwords
(C) server logs only (D) shipping labels only
21. A primary key uniquely identifies a
(A) row (B) column type only
(C) web page (D) payment gateway
22. Normalization reduces
(A) redundant data (B) encryption strength
(C) page width (D) network latency always
23. An index usually improves lookup speed at the cost of
(A) storage and write overhead (B) data correctness
(C) TLS security (D) user authentication
24. A cart is often tied to a user or anonymous
(A) session (B) certificate
(C) DNS zone (D) database trigger only
25. State management is needed because HTTP is fundamentally
(A) stateless (B) encrypted only
(C) peer to peer (D) transactional
26. Checkout commonly includes cart review, address, shipping, and
(A) payment (B) model training
(C) SEO crawling (D) schema migration
27. An order status such as shipped indicates
(A) fulfillment progress (B) password strength
(C) tax rate only (D) browser type
28. Inventory reservation helps prevent
(A) overselling (B) TLS expiry
(C) duplicate CSS (D) slow DNS
29. A payment gateway connects the merchant to
(A) payment processing networks (B) search engines
(C) warehouse robots only (D) social media
30. Authorization in a card payment asks whether the transaction is
(A) approved (B) refunded
(C) shipped (D) indexed
31. Authentication verifies
(A) identity (B) permission level only
(C) price (D) stock count
32. PCI DSS concerns protection of
(A) cardholder data (B) search rankings
(C) product photos (D) shipping routes only
33. TLS protects data in transit using
(A) encryption and certificates (B) plain text
(C) SQL joins (D) cookies only
34. A digital certificate binds a public key to
(A) an identity (B) a shopping cart
(C) an invoice total (D) a stock unit
35. A hash is commonly used for
(A) integrity verification (B) reversible encryption
(C) screen layout (D) load balancing only
36. SQL injection targets applications by inserting malicious
(A) SQL input (B) CSS colors
(C) image pixels (D) DNS labels
37. Cross-site scripting injects script into content viewed by
(A) other users (B) the database engine only
(C) the payment bank only (D) the router only
38. CSRF tricks a logged-in browser into sending
(A) an unwanted request (B) a product image
(C) a DNS query only (D) a password hash
39. A secure password should be stored using a slow salted
(A) password hash (B) plain text field
(C) URL parameter (D) cookie value
40. CRM focuses on managing
(A) customer relationships (B) server processors
(C) source control branches (D) warehouse voltage
41. A recommendation engine may use
(A) collaborative filtering (B) TLS handshakes
(C) DNS recursion (D) database vacuum only
42. Collaborative filtering uses patterns in
(A) user-item interactions (B) HTML tags only
(C) tax tables (D) IP routes
43. Supply chain management coordinates sourcing, inventory, and
(A) fulfillment (B) CSS rules
(C) browser tabs (D) encryption keys
44. SEO aims to improve visibility in
(A) unpaid search results (B) payment authorization
(C) warehouse robots (D) private databases
45. SEM commonly uses
(A) paid search advertising (B) stock encryption
(C) unit tests (D) session cookies only
46. Conversion rate is conversions divided by
(A) visitors or relevant sessions (B) inventory units only
(C) employees (D) page bytes
47. Email marketing should respect
(A) consent and unsubscribe rules (B) password reuse
(C) hidden tracking only (D) duplicate billing
48. M-commerce refers to commerce through
(A) mobile devices (B) main-frame terminals only
(C) printed brochures (D) warehouse scanners only
49. Responsive design adapts layout to
(A) screen size and context (B) database schema
(C) payment type (D) tax jurisdiction only
50. A progressive web app can provide installability using
(A) web technologies and a manifest (B) SQL triggers
(C) FTP only (D) a card reader
51. IaaS provides virtualized compute, storage, and
(A) networking (B) finished business software
(C) product reviews (D) tax policy
52. PaaS primarily manages runtime infrastructure so developers focus on
(A) application code (B) server hardware
(C) office leases (D) card embossing
53. Caching reduces latency by serving data from
(A) a nearer stored copy (B) a new database each time
(C) a payment bank (D) a DNS registrar only
54. A load balancer distributes requests across
(A) service instances (B) product categories
(C) tax brackets (D) customer reviews
55. Auto-scaling changes capacity based on
(A) demand or metrics (B) logo color
(C) order title (D) certificate name only
56. High availability aims to reduce
(A) service downtime (B) product price
(C) data normalization (D) SEO keywords
57. A disaster recovery plan defines how to restore
(A) critical service and data (B) advertising copy
(C) CSS themes (D) customer personas only
58. A backup is useful only if it can be
(A) restored and verified (B) compressed forever
(C) viewed publicly (D) used as a password
59. GDPR principles include data minimization and
(A) purpose limitation (B) unlimited retention
(C) secret profiling (D) no user rights
60. A privacy notice should explain
(A) data collection and use (B) server CPU speed
(C) source code style (D) discount formulas only
61. A VAT amount is computed as taxable price times
(A) tax rate (B) conversion rate
(C) inventory turnover (D) click-through rate
62. A 100 dollars item with a 10 percent discount costs before tax
(A) 90 dollars (B) 10 dollars
(C) 1000 dollars (D) 110 dollars
63. Gross margin equals revenue minus
(A) cost of goods sold (B) page views
(C) tax rate (D) server uptime
64. Break-even units equal fixed costs divided by
(A) contribution margin per unit (B) revenue per visitor
(C) tax amount (D) stock level
65. ROI is commonly net return divided by
(A) investment cost (B) number of products
(C) page load time (D) tax rate
66. Average order value is total revenue divided by
(A) number of orders (B) number of visitors only
(C) inventory items (D) support tickets
67. Cart abandonment rate measures carts not completed relative to
(A) created carts (B) shipped orders
(C) product views only (D) refunds only
68. A/B testing compares
(A) two variants under measured outcomes (B) two databases without users
(C) two passwords (D) two warehouses only
69. An idempotent payment request can be safely repeated without
(A) creating an extra charge (B) updating a page
(C) checking stock (D) logging an event
70. Tokenization replaces sensitive card data with
(A) a non-sensitive token (B) a public password
(C) a product SKU (D) a tax code
71. A webhook is an HTTP callback triggered by
(A) an event (B) a CSS change
(C) a database column type (D) a keyboard action
72. A CDN serves static content from
(A) distributed edge locations (B) one local laptop
(C) the payment gateway only (D) a SQL console
73. An order database should link each order to its items through
(A) an order line entity (B) a CSS selector
(C) a DNS record (D) a TLS cipher
74. The principle of least privilege grants users
(A) only needed permissions (B) every permission
(C) no authentication (D) shared passwords
75. Rate limiting helps defend an API against
(A) request floods (B) data normalization
(C) image scaling (D) tax calculation
76. An HTTP 404 response means the requested resource was
(A) not found (B) unauthorized
(C) successfully created (D) temporarily redirected
77. An HTTP 500 response indicates a
(A) server-side error (B) client-side cache hit
(C) successful payment (D) valid certificate
78. Inventory turnover relates cost of goods sold to
(A) average inventory (B) page views
(C) tax rate (D) cart size
79. An abandoned cart reminder should avoid exposing
(A) another user's order data (B) public product names
(C) shipping choices (D) a consent record
80. Eventual consistency means replicas may temporarily
(A) disagree (B) lose all data
(C) reject every write (D) use no storage
