

SUMMER EXAMINATION 2026
E-commerce Application Development - Version A
BSIT - 3rd Semester Time: 90 Minutes Max Marks: 80

Name: _____ Roll No.: _____ Date: _____

1. A progressive web app can provide installability using
(A) web technologies and a manifest (B) SQL triggers
(C) FTP only (D) a card reader
2. Break-even units equal fixed costs divided by
(A) contribution margin per unit (B) revenue per visitor
(C) tax amount (D) stock level
3. A cart is often tied to a user or anonymous
(A) session (B) certificate
(C) DNS zone (D) database trigger only
4. IaaS provides virtualized compute, storage, and
(A) networking (B) finished business software
(C) product reviews (D) tax policy
5. Authentication verifies
(A) identity (B) permission level only
(C) price (D) stock count
6. High availability aims to reduce
(A) service downtime (B) product price
(C) data normalization (D) SEO keywords
7. The front end is primarily responsible for
(A) user interface and interaction (B) database backups
(C) tax filing (D) server rack cooling
8. Email marketing should respect
(A) consent and unsubscribe rules (B) password reuse
(C) hidden tracking only (D) duplicate billing
9. A backup is useful only if it can be
(A) restored and verified (B) compressed forever
(C) viewed publicly (D) used as a password
10. CRM focuses on managing
(A) customer relationships (B) server processors
(C) source control branches (D) warehouse voltage
11. REST commonly identifies resources with
(A) URIs (B) random passwords
(C) MAC addresses only (D) SQL triggers
12. An order database should link each order to its items through
(A) an order line entity (B) a CSS selector
(C) a DNS record (D) a TLS cipher
13. A privacy notice should explain
(A) data collection and use (B) server CPU speed
(C) source code style (D) discount formulas only
14. A secure password should be stored using a slow salted
(A) password hash (B) plain text field
(C) URL parameter (D) cookie value
15. Supply chain management coordinates sourcing, inventory, and
(A) fulfillment (B) CSS rules
(C) browser tabs (D) encryption keys
16. Gross margin equals revenue minus
(A) cost of goods sold (B) page views
(C) tax rate (D) server uptime
17. Checkout commonly includes cart review, address, shipping, and
(A) payment (B) model training
(C) SEO crawling (D) schema migration
18. A disaster recovery plan defines how to restore
(A) critical service and data (B) advertising copy
(C) CSS themes (D) customer personas only
19. An HTTP 500 response indicates a
(A) server-side error (B) client-side cache hit
(C) successful payment (D) valid certificate
20. B2C describes transactions between
(A) business and consumer (B) businesses only
(C) consumer and government (D) employees only
21. A webhook is an HTTP callback triggered by
(A) an event (B) a CSS change
(C) a database column type (D) a keyboard action
22. A load balancer distributes requests across
(A) service instances (B) product categories
(C) tax brackets (D) customer reviews
23. Acceptance testing checks whether the system meets
(A) business requirements (B) CPU temperature
(C) font availability (D) DNS records
24. A/B testing compares
(A) two variants under measured outcomes (B) two databases without users
(C) two passwords (D) two warehouses only
25. A product catalog stores product details such as
(A) name, price, and stock (B) only customer passwords
(C) server logs only (D) shipping labels only
26. A primary key uniquely identifies a
(A) row (B) column type only
(C) web page (D) payment gateway
27. SEO aims to improve visibility in
(A) unpaid search results (B) payment authorization
(C) warehouse robots (D) private databases
28. M-commerce refers to commerce through
(A) mobile devices (B) mainframe terminals only
(C) printed brochures (D) warehouse scanners only
29. A digital certificate binds a public key to
(A) an identity (B) a shopping cart
(C) an invoice total (D) a stock unit
30. A 100 dollars item with a 10 percent discount costs before tax
(A) 90 dollars (B) 10 dollars
(C) 1000 dollars (D) 110 dollars
31. TLS protects data in transit using
(A) encryption and certificates (B) plain text
(C) SQL joins (D) cookies only
32. In a client-server system, the client usually
(A) requests services (B) stores every server record
(C) routes packets physically (D) issues certificates
33. Average order value is total revenue divided by
(A) number of orders (B) number of visitors only
(C) inventory items (D) support tickets
34. C2C platforms primarily connect
(A) consumers with consumers (B) banks with regulators
(C) manufacturers with servers (D) governments with firms
35. The SDLC phase that clarifies user needs is
(A) requirements analysis (B) deployment
(C) archiving (D) encryption
36. Cross-site scripting injects script into content viewed by
(A) other users (B) the database engine only
(C) the payment bank only (D) the router only
37. An index usually improves lookup speed at the cost of
(A) storage and write overhead (B) data correctness
(C) TLS security (D) user authentication
38. A recommendation engine may use
(A) collaborative filtering (B) TLS handshakes
(C) DNS recursion (D) database vacuum only
39. State management is needed because HTTP is fundamentally
(A) stateless (B) encrypted only
(C) peer to peer (D) transactional
40. HTTP is mainly used for
(A) web request and response transfer (B) password hashing
(C) database normalization (D) image compression only

SUMMER EXAMINATION 2026
E-commerce Application Development - Version A
BSIT - 3rd Semester Time: 90 Minutes Max Marks: 80

Name: _____ Roll No.: _____ Date: _____

1. HTTPS adds HTTP protection using
(A) TLS encryption (B) FTP tunneling
(C) plain text (D) DNS caching only
2. A VAT amount is computed as taxable price times
(A) tax rate (B) conversion rate
(C) inventory turnover (D) click-through rate
3. The principle of least privilege grants users
(A) only needed permissions (B) every permission
(C) no authentication (D) shared passwords
4. The back end commonly handles
(A) business logic and data access (B) screen pixels only
(C) browser history (D) keyboard firmware
5. Caching reduces latency by serving data from
(A) a nearer stored copy (B) a new database each time
(C) a payment bank (D) a DNS registrar only
6. Normalization reduces
(A) redundant data (B) encryption strength
(C) page width (D) network latency always
7. Cart abandonment rate measures carts not completed relative to
(A) created carts (B) shipped orders
(C) product views only (D) refunds only
8. GDPR principles include data minimization and
(A) purpose limitation (B) unlimited retention
(C) secret profiling (D) no user rights
9. A three-tier architecture separates presentation, application logic, and
(A) data (B) marketing
(C) payment cards (D) DNS names
10. Responsive design adapts layout to
(A) screen size and context (B) database schema
(C) payment type (D) tax jurisdiction only
11. E-commerce is the buying and selling of goods or services through
(A) electronic networks (B) only physical stores
(C) radio broadcasts (D) printed catalogs
12. PaaS primarily manages runtime infrastructure so developers focus on
(A) application code (B) server hardware
(C) office leases (D) card embossing
13. Rate limiting helps defend an API against
(A) request floods (B) data normalization
(C) image scaling (D) tax calculation
14. CSRF tricks a logged-in browser into sending
(A) an unwanted request (B) a product image
(C) a DNS query only (D) a password hash
15. An HTTP 404 response means the requested resource was
(A) not found (B) unauthorized
(C) successfully created (D) temporarily redirected
16. Eventual consistency means replicas may temporarily
(A) disagree (B) lose all data
(C) reject every write (D) use no storage
17. An order status such as shipped indicates
(A) fulfillment progress (B) password strength
(C) tax rate only (D) browser type
18. A hash is commonly used for
(A) integrity verification (B) reversible encryption
(C) screen layout (D) load balancing only
19. SEM commonly uses
(A) paid search advertising (B) stock encryption
(C) unit tests (D) session cookies only
20. Collaborative filtering uses patterns in
(A) user-item interactions (B) HTML tags only
(C) tax tables (D) IP routes
21. Conversion rate is conversions divided by
(A) visitors or relevant sessions (B) inventory units only
(C) employees (D) page bytes
22. In MVC, the model represents
(A) data and domain state (B) page styling only
(C) HTTP transport (D) user passwords only
23. Inventory turnover relates cost of goods sold to
(A) average inventory (B) page views
(C) tax rate (D) cart size
24. An idempotent payment request can be safely repeated without
(A) creating an extra charge (B) updating a page
(C) checking stock (D) logging an event
25. ROI is commonly net return divided by
(A) investment cost (B) number of products
(C) page load time (D) tax rate
26. Authorization in a card payment asks whether the transaction is
(A) approved (B) refunded
(C) shipped (D) indexed
27. Inventory reservation helps prevent
(A) overselling (B) TLS expiry
(C) duplicate CSS (D) slow DNS
28. A CDN serves static content from
(A) distributed edge locations (B) one local laptop
(C) the payment gateway only (D) a SQL console
29. An abandoned cart reminder should avoid exposing
(A) another user's order data (B) public product names
(C) shipping choices (D) a consent record
30. Subscription revenue is based on
(A) recurring payments (B) one-time auctions only
(C) random discounts (D) inventory destruction
31. Auto-scaling changes capacity based on
(A) demand or metrics (B) logo color
(C) order title (D) certificate name only
32. MVC separates model, view, and
(A) controller (B) cache
(C) certificate (D) customer
33. Tokenization replaces sensitive card data with
(A) a non-sensitive token (B) a public password
(C) a product SKU (D) a tax code
34. Microservices decompose a system into
(A) independently deployable services (B) one giant database table
(C) static HTML only (D) one shared process only
35. Unit testing focuses on
(A) small software components (B) the whole market
(C) payment settlement (D) network topology
36. A payment gateway connects the merchant to
(A) payment processing networks (B) search engines
(C) warehouse robots only (D) social media
37. PCI DSS concerns protection of
(A) cardholder data (B) search rankings
(C) product photos (D) shipping routes only
38. SQL injection targets applications by inserting malicious
(A) SQL input (B) CSS colors
(C) image pixels (D) DNS labels
39. A marketplace model commonly earns revenue through
(A) commissions or listing fees (B) CPU cycles
(C) file permissions (D) sensor voltage
40. An API is a defined interface for
(A) software interaction (B) image cropping
(C) tax calculation only (D) font selection
