

SUMMER EXAMINATION 2026
E-commerce Application Development - Version B
BSIT - 3rd Semester Time: 90 Minutes Max Marks: 80

Name: _____ Roll No.: _____ Date: _____

1. Inventory turnover relates cost of goods sold to
(A) average inventory (B) page views
(C) tax rate (D) cart size
2. A load balancer distributes requests across
(A) service instances (B) product categories
(C) tax brackets (D) customer reviews
3. Average order value is total revenue divided by
(A) number of orders (B) number of visitors only
(C) inventory items (D) support tickets
4. Cart abandonment rate measures carts not completed relative to
(A) created carts (B) shipped orders
(C) product views only (D) refunds only
5. SEO aims to improve visibility in
(A) unpaid search results (B) payment authorization
(C) warehouse robots (D) private databases
6. Caching reduces latency by serving data from
(A) a nearer stored copy (B) a new database each time
(C) a payment bank (D) a DNS registrar only
7. The principle of least privilege grants users
(A) only needed permissions (B) every permission
(C) no authentication (D) shared passwords
8. PaaS primarily manages runtime infrastructure so developers focus on
(A) application code (B) server hardware
(C) office leases (D) card embossing
9. Collaborative filtering uses patterns in
(A) user-item interactions (B) HTML tags only
(C) tax tables (D) IP routes
10. A 100 dollars item with a 10 percent discount costs before tax
(A) 90 dollars (B) 10 dollars
(C) 1000 dollars (D) 110 dollars
11. SEM commonly uses
(A) paid search advertising (B) stock encryption
(C) unit tests (D) session cookies only
12. A VAT amount is computed as taxable price times
(A) tax rate (B) conversion rate
(C) inventory turnover (D) click-through rate
13. The SDLC phase that clarifies user needs is
(A) requirements analysis (B) deployment
(C) archiving (D) encryption
14. PCI DSS concerns protection of
(A) cardholder data (B) search rankings
(C) product photos (D) shipping routes only
15. C2C platforms primarily connect
(A) consumers with consumers (B) banks with regulators
(C) manufacturers with servers (D) governments with firms
16. A/B testing compares
(A) two variants under measured outcomes (B) two databases without users
(C) two passwords (D) two warehouses only
17. B2C describes transactions between
(A) business and consumer (B) businesses only
(C) consumer and government (D) employees only
18. A digital certificate binds a public key to
(A) an identity (B) a shopping cart
(C) an invoice total (D) a stock unit
19. Acceptance testing checks whether the system meets
(A) business requirements (B) CPU temperature
(C) font availability (D) DNS records
20. The front end is primarily responsible for
(A) user interface and interaction (B) database backups
(C) tax filing (D) server rack cooling
21. A backup is useful only if it can be
(A) restored and verified (B) compressed forever
(C) viewed publicly (D) used as a password
22. An index usually improves lookup speed at the cost of
(A) storage and write overhead (B) data correctness
(C) TLS security (D) user authentication
23. A webhook is an HTTP callback triggered by
(A) an event (B) a CSS change
(C) a database column type (D) a keyboard action
24. High availability aims to reduce
(A) service downtime (B) product price
(C) data normalization (D) SEO keywords
25. MVC separates model, view, and
(A) controller (B) cache
(C) certificate (D) customer
26. A marketplace model commonly earns revenue through
(A) commissions or listing fees (B) CPU cycles
(C) file permissions (D) sensor voltage
27. A secure password should be stored using a slow salted
(A) password hash (B) plain text field
(C) URL parameter (D) cookie value
28. Eventual consistency means replicas may temporarily
(A) disagree (B) lose all data
(C) reject every write (D) use no storage
29. SQL injection targets applications by inserting malicious
(A) SQL input (B) CSS colors
(C) image pixels (D) DNS labels
30. GDPR principles include data minimization and
(A) purpose limitation (B) unlimited retention
(C) secret profiling (D) no user rights
31. E-commerce is the buying and selling of goods or services through
(A) electronic networks (B) only physical stores
(C) radio broadcasts (D) printed catalogs
32. An order status such as shipped indicates
(A) fulfillment progress (B) password strength
(C) tax rate only (D) browser type
33. CSRF tricks a logged-in browser into sending
(A) an unwanted request (B) a product image
(C) a DNS query only (D) a password hash
34. Email marketing should respect
(A) consent and unsubscribe rules (B) password reuse
(C) hidden tracking only (D) duplicate billing
35. An HTTP 500 response indicates a
(A) server-side error (B) client-side cache hit
(C) successful payment (D) valid certificate
36. An API is a defined interface for
(A) software interaction (B) image cropping
(C) tax calculation only (D) font selection
37. Break-even units equal fixed costs divided by
(A) contribution margin per unit (B) revenue per visitor
(C) tax amount (D) stock level
38. An HTTP 404 response means the requested resource was
(A) not found (B) unauthorized
(C) successfully created (D) temporarily redirected
39. Unit testing focuses on
(A) small software components (B) the whole market
(C) payment settlement (D) network topology
40. Normalization reduces
(A) redundant data (B) encryption strength
(C) page width (D) network latency always

SUMMER EXAMINATION 2026
E-commerce Application Development - Version B
BSIT - 3rd Semester Time: 90 Minutes Max Marks: 80

Name: _____ Roll No.: _____ Date: _____

1. CRM focuses on managing
(A) customer relationships (B) server processors
(C) source control branches (D) warehouse voltage
2. In a client-server system, the client usually
(A) requests services (B) stores every server record
(C) routes packets physically (D) issues certificates
3. M-commerce refers to commerce through
(A) mobile devices (B) mainframe terminals only
(C) printed brochures (D) warehouse scanners only
4. A product catalog stores product details such as
(A) name, price, and stock (B) only customer passwords
(C) server logs only (D) shipping labels only
5. Authorization in a card payment asks whether the transaction is
(A) approved (B) refunded
(C) shipped (D) indexed
6. Responsive design adapts layout to
(A) screen size and context (B) database schema
(C) payment type (D) tax jurisdiction only
7. Subscription revenue is based on
(A) recurring payments (B) one-time auctions only
(C) random discounts (D) inventory destruction
8. Microservices decompose a system into
(A) independently deployable services (B) one giant database table
(C) static HTML only (D) one shared process only
9. An idempotent payment request can be safely repeated without
(A) creating an extra charge (B) updating a page
(C) checking stock (D) logging an event
10. Checkout commonly includes cart review, address, shipping, and
(A) payment (B) model training
(C) SEO crawling (D) schema migration
11. Auto-scaling changes capacity based on
(A) demand or metrics (B) logo color
(C) order title (D) certificate name only
12. A recommendation engine may use
(A) collaborative filtering (B) TLS handshakes
(C) DNS recursion (D) database vacuum only
13. REST commonly identifies resources with
(A) URIs (B) random passwords
(C) MAC addresses only (D) SQL triggers
14. A primary key uniquely identifies a
(A) row (B) column type only
(C) web page (D) payment gateway
15. IaaS provides virtualized compute, storage, and
(A) networking (B) finished business software
(C) product reviews (D) tax policy
16. Authentication verifies
(A) identity (B) permission level only
(C) price (D) stock count
17. In MVC, the model represents
(A) data and domain state (B) page styling only
(C) HTTP transport (D) user passwords only
18. A cart is often tied to a user or anonymous
(A) session (B) certificate
(C) DNS zone (D) database trigger only
19. A hash is commonly used for
(A) integrity verification (B) reversible encryption
(C) screen layout (D) load balancing only
20. A progressive web app can provide installability using
(A) web technologies and a manifest (B) SQL triggers
(C) FTP only (D) a card reader
21. A CDN serves static content from
(A) distributed edge locations (B) one local laptop
(C) the payment gateway only (D) a SQL console
22. HTTP is mainly used for
(A) web request and response transfer (B) password hashing
(C) database normalization (D) image compression only
23. A three-tier architecture separates presentation, application logic, and
(A) data (B) marketing
(C) payment cards (D) DNS names
24. An abandoned cart reminder should avoid exposing
(A) another user's order data (B) public product names
(C) shipping choices (D) a consent record
25. TLS protects data in transit using
(A) encryption and certificates (B) plain text
(C) SQL joins (D) cookies only
26. The back end commonly handles
(A) business logic and data access (B) screen pixels only
(C) browser history (D) keyboard firmware
27. A disaster recovery plan defines how to restore
(A) critical service and data (B) advertising copy
(C) CSS themes (D) customer personas only
28. Supply chain management coordinates sourcing, inventory, and
(A) fulfillment (B) CSS rules
(C) browser tabs (D) encryption keys
29. An order database should link each order to its items through
(A) an order line entity (B) a CSS selector
(C) a DNS record (D) a TLS cipher
30. Gross margin equals revenue minus
(A) cost of goods sold (B) page views
(C) tax rate (D) server uptime
31. Cross-site scripting injects script into content viewed by
(A) other users (B) the database engine only
(C) the payment bank only (D) the router only
32. A payment gateway connects the merchant to
(A) payment processing networks (B) search engines
(C) warehouse robots only (D) social media
33. Inventory reservation helps prevent
(A) overselling (B) TLS expiry
(C) duplicate CSS (D) slow DNS
34. ROI is commonly net return divided by
(A) investment cost (B) number of products
(C) page load time (D) tax rate
35. HTTPS adds HTTP protection using
(A) TLS encryption (B) FTP tunneling
(C) plain text (D) DNS caching only
36. A privacy notice should explain
(A) data collection and use (B) server CPU speed
(C) source code style (D) discount formulas only
37. Conversion rate is conversions divided by
(A) visitors or relevant sessions (B) inventory units only
(C) employees (D) page bytes
38. Tokenization replaces sensitive card data with
(A) a non-sensitive token (B) a public password
(C) a product SKU (D) a tax code
39. State management is needed because HTTP is fundamentally
(A) stateless (B) encrypted only
(C) peer to peer (D) transactional
40. Rate limiting helps defend an API against
(A) request floods (B) data normalization
(C) image scaling (D) tax calculation
